CEMENTO

Decorative plaster for "concrete" effect

Description	STONE–CEMENTO is a pre-blended plaster made of water dispersible acrylic resin, micronized inert charges, light stable pigments and specific additives. Recommended for fine decoration of interior walls where a "concrete" effect is desired.

Method of application

Base Coat
- after the wall preparation, apply a priming undercoat of VIEROQUARTZ thinned 1:1 in water in the same colour of STONE–CEMENTO. The use of VIEROQUARTZ as a base coat gives an initial coloured covering and protection and facilitates the application of the coating.

Steel trowel + sorghum broom/roller + brush
1. When VIEROQUARTZ is completely dry, apply a uniform layer of STONE–CEMENTO with a small stainless steel trowel all over the surface as base coat
2. Once the first coat is dry, apply with the same tool a consistent layer about 3mm thick of STONE–CEMENTO to the wall
3. Pass over the surface vertically with a sorghum broom. For a different effect you can also roll over the surface with a wool or rubber roller in a specific texture
4. As soon as the plaster is no longer tacky to the touch work across vertically the surface with a blade of stainless steel trowel in a quick sweeping action to smooth the surface. If necessary polish the surface with a fine grain sandpaper
5. If desired apply by brush a grout of diluted product (ratio 2:1 with water) adding 5% –10 % of VIERO BITUME DECORATIVO.
6. Once dried, smooth and burnish the wall with a soft stainless steel spatula thus breaking the black spots contained in the grout.
7. The last step in the STONE–CEMENTO application is the application of the whitening coat. Apply VIEROSIL VEL in a white color (thinned 1:5 with water), by brush all over the surface according to the aesthetic effect required
8. Wait until dry and buff it with a dry, clean cotton cloth

Consumption rate	1,7–2,0 Kg/m²
Interiors / Exteriors	Interiors
Warning	The colours shown are indicative only

CEMENTO – lined effect with Bitume

CEMENTO – scratched effect
